Safety Information

DANGER:
Electrical current from power, telephone, and communication cables is hazardous. To avoid shock hazard, connect and disconnect cables as shown below when installing, moving or opening the covers of this product or attached devices. The power cord must be used with a properly grounded outlet.

**To Connect**
- Turn everything OFF.
- First, attach all cables to devices.¹
- Attach signal cables to receptacles.
- Attach power cord to outlet.
- Turn device ON.

**To Disconnect**
- Turn everything OFF.
- First, remove power cord from outlet.²
- Remove signal cables from receptacles.
- Remove all cables from devices.

¹ In the U.K., by law, the telephone cable must be connected after the power cord.
² In the U.K., by law, the power cord must be disconnected after the telephone line cable.

Laser Compliance Statement

Some IBM Personal Computer models are equipped from the factory with a CD-ROM drive. CD-ROM drives are also sold separately as options. The CD-ROM drive is a laser product. The CD-ROM drive is certified in the U.S. to conform to the requirements of the Department of Health and Human Services 21 Code of Federal Regulations (DHHS 21 CFR) Subchapter J for Class 1 laser products. Elsewhere, the drive is certified to conform to the requirements of the International Electrotechnical Commission (IEC) 825 and CENELEC EN 60 825 for Class 1 laser products.

When a CD-ROM drive is installed, note the following.

CAUTION:
Use of controls or adjustments or performance of procedures other than those specified herein might result in hazardous radiation exposure.

Opening the CD-ROM drive could result in exposure to hazardous laser radiation. There are no serviceable parts inside the CD-ROM drive. Do not open.

Some CD-ROM drives contain an embedded Class 3A or Class 3B laser diode. Note the following.

DANGER

Laser radiation when open. Do not stare into the beam, do not view directly with optical instruments, and avoid direct exposure to the beam.
Lithium Battery Notice

CAUTION:
Danger of explosion if battery is incorrectly replaced.

When replacing the battery, use only IBM Part Number 33F8354 or an equivalent type battery recommended by the manufacturer. The battery contains lithium and can explode if not properly used, handled, or disposed of.

Do not:
• Throw or immerse into water
• Heat to more than 100°C (212°F)
• Repair or disassemble

Dispose of the battery as required by local ordinances or regulations.

ATTENTION
Danger d'explosion en cas de remplacement incorrect de la batterie.

Remplacer uniquement par une batterie IBM de type 33F8354 ou d'un type équivalent recommandé par le fabricant. La batterie contient du lithium et peut exploser en cas de mauvaise utilisation, de mauvaise manipulation ou de mise au rebut inappropriée.

Ne pas :
• Lancer ou plonger dans l'eau
• Chauffer à plus de 100°C (212°F)
• Réparer ou désassembler

Mettre au rebut les batteries usagées conformément aux règlements locaux.
About This Book

Thank you for selecting an IBM Personal Computer.

This book provides instructions for installing, removing, and replacing most options. Also, this book contains information to help you decide which options to add to your computer.

Note: The illustrations in this publication might be slightly different from your hardware.
How This Book Is Organized

This book contains the following chapters and appendixes:

- Chapter 1, “Overview” provides an introduction to the options and features for your computer. Safety precautions and handling techniques are discussed along with the required tools you will need to install and remove options.

- Chapter 2, “Preparing to Install and Remove Options” provides instructions for removing the cover and cables for your computer and for locating the components you want to work with.

- Chapter 3, “Working with Options on the System Board” provides instructions for locating, accessing, and working with options on the system board.

- Chapter 4, “Working with Adapters and Internal Drives” provides instructions for installing and removing adapters and drives.

- Chapter 5, “Working with Security Options” describes features such as the security U-bolt and erasing lost or forgotten passwords. Information on diskette-write protection is also provided.

- Chapter 6, “Completing the Installation” provides instructions for reassembling your computer after you have finished installing options. Information about using the Configuration/Setup Utility program is also provided.

- Appendix A, “Changing the Battery” explains how to change your computer backup battery and the precautions you should take when handling and disposing of the battery.

- Appendix B, “Interrupt and DMA Resources” contains the default interrupt and direct memory access (DMA) resources for your computer.

Related Publications

The following publications, together with this book, contain information about your computer.

- **Setting Up Your Personal Computer**
  This publication contains instructions to help you set up your computer.

- **Using Your Personal Computer**
  This publication contains the following:
  - Instructions for configuring, operating, and maintaining your computer
  - Information on diagnosing and solving computer problems and how to get help and service
  - Warranty information

- **Understanding Your Personal Computer**
  This online publication (provided only with computers that have IBM-preinstalled software) includes general information about using personal computers and in-depth information about the specific features of your computer. To purchase a printed copy of this publication, refer to the section on ordering publications in the "Getting Help, Service, and Information" chapter in *Using Your Personal Computer*.

- **About Your Software**
  This publication (provided only with computers that have IBM-preinstalled software) contains information about the preinstalled software package.

- **Adaptec SCSI Documentation**
  This documentation, which is provided with computers that have an IBM-installed SCSI adapter, includes information on configuring the adapter and instructions for installing and configuring SCSI devices.

- **Your Ready-to-Configure CD**
  This publication contains information about the Ready-to-Configure CD that comes with your computer. The publication also contains instructions for starting the CD.

The following publications contain more information about your computer.

- **Hardware Maintenance Manual**
  This separately purchased publication contains information for trained service technicians. To obtain a copy, refer to the section on ordering publications in the "Getting Help, Service, and Information" chapter in *Using Your Personal Computer*.
• Technical Information Manual

This publication is available on the World Wide Web only, at http://www.us.pc.ibm.com/cdt/treport.html. It contains information for individuals who want to know more about the technical aspects of their computer.
Chapter 1. Overview

Adding hardware options to your computer is an easy way to increase its capabilities. Instructions for removing, installing, and replacing options and features are included in this book. When adding an option, use these instructions along with the instructions that come with the option. If you have installed options before, you might be able to perform some activities without detailed instructions.

This chapter provides a brief introduction to the options and features that are discussed in this book. Also, important information about required tools, electrical safety, and static-sensitive devices is discussed.

Important

Before you install or remove any option, read the safety procedures and component-handling guidelines in this chapter. These precautions and guidelines will help you work safely.

Refer to Using Your Personal Computer for general information on the use, operation, and maintenance of your computer. Using Your Personal Computer also contains information to help you solve problems and get repair service or other technical assistance.
Available Options and Features

The following are some of the available options and features that are discussed in this book:

- System board components
  - System memory, called dual in-line memory modules (DIMMs)
  - Microprocessor upgrades
  - Switch for diskette-write protection
  - Jumper for erasing lost or forgotten passwords
  - Battery
- Adapters
  - Industry standard architecture (ISA) adapters
  - Peripheral component interconnect (PCI) adapters
- Internal drives
- Security U-bolt

Additional options are available from IBM. An options package is available for your computer that includes a floor stand, bottom cover, and rear cover. Although these options are not covered in this book, they come with complete installation instructions.

The following are some other available options and features for your computer. For more information, refer to the documentation that comes with the optional hardware.

- Adding an infrared transceiver allows wireless communication between your computer and other infrared-capable devices. Information about related software is included on the Ready-to-Configure CD. For more information on the transceiver, refer to the documentation that comes with it.
- Your computer can be remotely started using Wake on LAN, which is supported by the Ethernet that is built into your system board. For more information on Wake on LAN, see Using Your Personal Computer.
- To help with power management, you can add a modem and have your computer start when a ring is detected by the modem. Using an internal modem, you can use the Configuration/Setup Utility program to enable Modem Ring Detect, or using an external modem, you can enable Serial Port Ring Detect. For more information, see Using Your Personal Computer.
IBM provides help in selecting drives, cables, and other options for your computer. For the latest information about available options:

- Within the United States, call 1-800-IBM-2YOU (1-800-426-2968), your place of purchase, or your IBM reseller.
- Within Canada, call 1-800-565-3344 or 1-800-465-7999.
- Outside the United States and Canada, contact IBM, your place of purchase, or your IBM reseller.

IBM maintains pages on the World Wide Web where you can get information about IBM products and services, find the latest technical information, and download device drivers and updates. Some of these pages are:

- http://www.ibm.com Main IBM home page

**Tools Required**

To install or remove options in your computer, you will need a flat-head screwdriver. Any additional tools needed depend on the specific option and are noted in the instructions that come with the option.
Electrical Safety

CAUTION:
Electrical current from power, telephone, and communication cables can be hazardous. To avoid any shock hazard, disconnect all power cords and cables as described in the following information.

For your safety, always do the following before removing the cover:

1. Shut down all programs as described in your operating-system documentation.
2. Turn off the computer and any attached devices, such as printers, monitors, and external drives.
   
   **Note:** Personal computer users in the United Kingdom who have a modem or fax machine attached to their computer must disconnect the telephone line from the computer before unplugging any power cords (also known as power cables). When the computer is reassembled, users must reconnect the telephone line after plugging in the power cords.
3. Unplug all power cords from electrical outlets.
4. Disconnect all communication cables from external receptacles.
5. Disconnect all cables and power cords from the back of the computer.
   
   **Note:** Do not reconnect any cables or power cords until you reassemble the computer and put the cover back on.

CAUTION:
Never remove the cover on the power supply. If you have a problem with the power supply, have your computer serviced.
Handling Static-Sensitive Devices

Have you ever walked across a carpeted floor, then touched an object and received a small electrical shock? That’s static electricity, and although harmless to you, it can seriously damage computer components and options.

**Important**

When you add an option, do *not* open the static-protective package containing the option until you are instructed to do so.

When you handle options and other computer components, take these precautions to avoid static electricity damage:

- **Limit your movement.** Movement can cause static electricity to build up around you.
- **Always handle components carefully.** Handle adapters and memory-modules by the edges. Never touch any exposed circuitry.
- **Prevent others from touching components.**
- **When you are installing a new option,** touch the static-protective package containing the option to a metal expansion-slot cover or other unpainted metal surface on the computer for at least two seconds. This reduces static electricity in the package and your body.
- **When possible,** remove the option and install it directly in the computer without setting the option down. When this is not possible, place the static-protective package that the option came in on a smooth, level surface and place the option on it.
- **Do not place the option on the computer cover or other metal surface.**
Chapter 2. Preparing to Install and Remove Options

This chapter provides instructions for accessing and locating the options you want to install or remove.

Disconnecting Cables and Removing the Cover

Before you begin

- Read “Electrical Safety” on page 4 and “Handling Static-Sensitive Devices” on page 5.
- Remove any media (diskettes, compact discs, or tapes) from the drives, and then turn off all attached devices and the computer.

1 Disconnect all cables attached to the computer; this includes power cords, input/output (I/O) cables, and any other cables connected to the computer. The following illustrations show the rear of the computer.

Note: Your computer might differ from the one shown above. For more information on the rear connectors, see Setting Up Your Personal Computer.
**Note:** For more information on ports, including infrared and universal serial bus (USB), refer to *Understanding Your Personal Computer*.

2 If necessary, unlock the computer cover. (The cover lock is located on the rear of the computer.)

---

1 For more information on *Understanding Your Personal Computer*, see “Related Publications” on page ix.
3 Find the tabs on the rear of the computer cover and lift them up, then gently pull the cover toward you to release the back edge. Next, hold the cover by the sides and pull it forward about half an inch.

4 Lift the back edge and slide the cover forward until it comes free.

5 There may be a chassis intrusion detection switch enabled on your computer, which would require that you type in an administrator password after opening the cover. For information on the chassis intrusion detector, see "Chassis Intrusion Detector" in Using Your Personal Computer.
Locating Components

The following information helps you locate components and serves as a reference when you need to install options or connect input/output devices.

Internal View

The following illustration shows the internal view of your computer as seen from the front. For information on removing the cover, see “Disconnecting Cables and Removing the Cover” on page 6.

Note: The following illustration is for reference only.

Your computer comes with a diskette drive installed in bay 4 and a hard disk drive installed in bay 3. If your computer comes with a CD-ROM drive, it is installed in bay 1; if your computer comes with a SCSI adapter, it is installed in an expansion slot.

For more information on drive bays, see “Internal Drives” on page 39.
Input/Output Connectors

Input/output (I/O) connectors provide ports for transferring information into and out of your computer. You can connect a variety of I/O devices to your computer, including a monitor, keyboard, mouse, and printer. For more information on the ports and their specific technologies, see *Understanding Your Personal Computer*.

The rear of your computer contains the I/O connectors. Adapters installed in expansion slots might also provide I/O connectors. The following illustration shows the I/O connectors on the rear of your computer.
Chapter 3. Working with Options on the System Board

This chapter provides information about system board options discussed in this book.

The information in this chapter helps you identify parts on the system board. Also, instructions are provided for accessing and installing options on the system board. For example, you must have access to the system board to install system memory.

**Before you begin**

- Read “Electrical Safety” on page 4 and “Handling Static-Sensitive Devices” on page 5.
- Read the instructions that come with the option you want to install or replace.
- Turn off the computer and all other connected devices.
- Disconnect all external cables and power cords.

This chapter also provides instructions for installing, removing, and replacing system board components, specifically system memory and the microprocessor. For information on other system board components, see the appropriate section.
Identifying Parts on the System Board

The system board, also called the planar or motherboard, is the main circuit board in your computer. It provides basic computer functions and supports a variety of devices that are IBM-installed or that you can install later.

If you plan to install, remove, or replace hardware in your computer, you will need to know the layout of the system board. The following illustration shows the layout of the system board in your computer. The numbered pointers show the components that are discussed in this book.

Note: An illustration of the system board and additional information are provided on a label found on the underside of the computer cover.
Working with System Memory

You can add memory to your computer to increase system performance. Your computer has three connectors for installing system-memory modules. The maximum amount of system memory your computer supports is 384 MB.

Note: To locate the memory connectors inside your computer, see “Identifying Parts on the System Board” on page 12.

The memory modules your computer uses are *dual inline memory modules (DIMMs)*. The IBM-installed DIMMs that come with your computer are nonparity (NP) or ECC (error correcting code) EDO (Extended Data Out) modules.

When installing or replacing DIMMs, follow these rules:

- Use only 3.3 V unbuffered DIMMs.
- Each memory connector supports a maximum of 128 MB of EDO.
- Install only ECC EDO DIMMS to enable ECC.
- 60 ns EDO DIMMs are supported.
Memory Configuration

When you are adding or removing memory, you can use any combination of DIMM sizes 16, 32, 64, or 128 MB. A basic rule to follow is to fill each system memory connector sequentially, starting at Mem 0.

The following table shows suggested memory configurations for your computer; this table and additional information are also found on the underside of the computer cover. Again, alternative configurations are possible.

**Note:** Values in the following table are represented in megabytes (MB).

Installing a Memory Module

**Before you begin**

- Read “Electrical Safety” on page 4 and “Handling Static-Sensitive Devices” on page 5.
- Read the instructions that come with the new system memory.
- Turn off the computer and all other connected devices.
- Disconnect all cables attached to the computer and remove the computer cover (see “Disconnecting Cables and Removing the Cover” on page 6).

**Note:** For information on memory configuration, see Table 1 on page 14.

1. Be sure the retaining clips are in the open position, as shown in the second illustration below. If the retaining clips are perpendicular with the connector, push outward on them until they click open.

2. Touch the static-protective package containing the memory module to any unpainted metal surface in the computer, and then remove the module.

3. Position the module above the connector so that the two notches on the bottom edge of the module align properly with the connector.
4 Firmly push the module straight down into the connector until the retaining clips pop up and snugly fit around both ends of the module.

5 To install another memory module, repeat steps 1–4.

6 Go to the device-record form in *Using Your Personal Computer* and record this installation.

What to do next

- To work with another option, go to the appropriate section.
- To complete the installation, go to Chapter 6, “Completing the Installation” on page 66.
Removing a Memory Module

Before you begin

- Read “Electrical Safety” on page 4 and “Handling Static-Sensitive Devices” on page 5.
- Turn off the computer and all other connected devices.
- Disconnect all cables attached to the computer and remove the computer cover (see “Disconnecting Cables and Removing the Cover” on page 6).

1. At both ends of the memory module connector, push outward on the retaining clips until the module is loosened.
   
   **Note:** Be careful not to push too hard on the retaining clips because the module may abruptly eject from the connector.

2. Lift the memory module out of the connector.

3. Store the module in a static-protective package.

What to do next

- To work with another option, go to the appropriate section.
- To complete the installation, go to Chapter 6, “Completing the Installation” on page 66.
Installing Video Upgrades

Your computer supports one of several video upgrade options. These options include different types of multimedia or a video memory upgrade.

Important: Your computer supports a maximum of one video upgrade option. This means that you can add either a memory upgrade or a multimedia option, but not both.

Video Memory

The maximum amount of video memory the system board supports is 4 MB. Your computer comes with 2 MB of video memory already installed, and you can add an additional 2 MB of memory to increase system performance. (You can order an MGA Mystique 2 MB memory module from Matrox Graphics Inc.)

Tip

To see the amount of video memory installed in your computer, perform the following procedures:

1. Turn on your computer and start the Configuration/Setup Utility program (see “Starting the Configuration/Setup Utility Program” on page 71).
2. Select Devices and I/O Ports.
3. Select Video Setup.
4. Look under Video Memory. If the value is 2048 KB, your computer has 2 MB of video memory and can accept the upgrade. If the value is 4096 KB, the system board is already equipped with the maximum amount of video memory and an upgrade is not needed.
5. Exit from the Configuration/Setup Utility program.
Video Multimedia Upgrades

Your computer also supports the Matrox Rainbow Runner Studio multimedia upgrade modules (see the Using Your Personal Computer for more information about these multimedia upgrades). These multimedia upgrades require the additional installation of a cable and connector with a module. To install the cable and connector, you must remove the multimedia knockout area on the back of the computer. Follow the instructions included with the multimedia option from Matrox.

Before you begin

- Read “Electrical Safety” on page 4 and “Handling Static-Sensitive Devices” on page 5.
- Turn off the computer and all other connected devices.
- Disconnect all cables attached to the computer and remove the computer cover (see “Disconnecting Cables and Removing the Cover” on page 6).
- Locate the video upgrade module connectors on the system board. Refer to “Identifying Parts on the System Board” on page 12.
- If an adapter impedes your access to the video module connectors, remove it.
You will be able to upgrade your computer's multimedia functionality in only one of the ways shown in the following illustration.

To install video option upgrades:

1. Touch the static-protective package containing the upgrade module to any unpainted metal surface in the computer, and then remove the module from the package. Follow instructions included with the option.

2. Go to the device-record form in *Using Your Personal Computer* and record this installation.

What to do next

- If you removed an adapter and want to reinstall it, go to “Installing Adapters” on page 30.
- To work with another option, go to the appropriate section.
- To complete the installation, go to Chapter 6, “Completing the Installation” on page 66.
Upgrading a Microprocessor

Your computer comes with an Intel® microprocessor installed on the system board. It can be either a Pentium or a Pentium with MMX technology. (To see which microprocessor is installed in your computer, refer to the Configuration/Setup Utility Program.) For the latest information on microprocessor upgrades available for your computer, contact your place of purchase or your IBM reseller. If you do upgrade the microprocessor, use the instructions that come with the upgrade along with the instructions in this publication.

CAUTION:
The microprocessor and heat sink will be hot if the computer has been running. To avoid the possibility of a burn, if the computer has been on, let the microprocessor and heat sink cool for 10 minutes before continuing with the procedure.

Before you begin

- Read “Electrical Safety” on page 4 and “Handling Static-Sensitive Devices” on page 5.
- Read the instructions that come with the new microprocessor.
- Turn off the computer.
- Disconnect all cables attached to the computer and remove the computer cover (see “Disconnecting Cables and Removing the Cover” on page 6).
CAUTION:
When removing the heat sink and the microprocessor, be careful not to scrape any system board component. Also, the retaining clip is under tension and may disengage suddenly if it is not held while it is being removed.

1 Locate the microprocessor on the system board (see “Identifying Parts on the System Board” on page 12).

2 The slots on the ends of the retaining clip hook over the tabs found on the microprocessor connector. At the top of the clip is a "loop" to help with removal.

To remove the retaining clip, simultaneously press down on the loop and unhook the nearest tab from the slot, then unhook the tab on the other side.

Note: Thermal grease is used to seal the heat sink to the microprocessor. Be careful not to get the grease on your skin. If the grease touches your skin or clothing, wash the area with soap and water.
3 Remove the retaining clip and the heat sink.

4 Release the lever on the side of the microprocessor connector and lift it all the way up. This releases the microprocessor. Lift the microprocessor out of the socket.

5 Store the old microprocessor in a static-protective package.

6 Touch the static-protective package containing the new microprocessor to any unpainted metal surface in the computer, and then remove the new microprocessor.
7 Align the pins of the new microprocessor with the socket and insert the microprocessor until it is properly seated.

**Note:** Be careful when inserting the microprocessor into the socket, because the pins of the microprocessor connect only one way.

Lower the lever to lock the microprocessor into position.

8 Apply thermal grease to the heat sink, then replace the heat sink and clip.
9 Press down on the loop to rehook the clip to the tabs on the connector.

What to do next

- To work with another option, go to the appropriate section.
- To complete the installation, go to Chapter 6, “Completing the Installation” on page 66.
Chapter 4. Working with Adapters and Internal Drives

This chapter provides information and instructions for installing and removing adapters and internal drives.

When you are installing or removing adapters, it is important to resolve any resource conflicts that might arise. For example, if you install an ISA legacy adapter, you might need to manually configure the adapter by setting a variety of switches on the adapter and by using the Configuration/Setup Utility program.

Many adapters now use Plug and Play technology which enables the computer to automatically configure the adapter, provided that the required resources are available. Refer to the instructions that come with your adapter to determine if it is Plug and Play. For more information, see “Adapter Configuration” on page 28.

When you are installing an internal drive, it is important to note what kind of drive you can install in each bay and the height restrictions imposed by each drive bay. Also, it is important to correctly connect the internal drive cables to the installed drive. For more information, see “Internal Drives” on page 39.

---

Before you begin

- Read “Electrical Safety” on page 4 and “Handling Static-Sensitive Devices” on page 5.
- Read the instructions that come with the option you want to install or replace.
- Turn off the computer and all other connected devices.
- Disconnect all cables attached to the computer and remove the computer cover (see “Disconnecting Cables and Removing the Cover” on page 6).
Adapters and the Riser Card

Your computer uses a riser card for expansion. The riser card contains expansion slots that connect adapters to the industry standard architecture (ISA) and peripheral component interconnect (PCI) buses.

You can install a variety of adapters in the expansion slots on the riser card. Some models come with an IBM-installed SCSI adapter. For information on locating the riser card, see “Locating Components” on page 9.

The riser card in your computer has two ISA slots and three PCI slots. The third PCI connector from the top shares a slot with the ISA connector directly below it. The other slots are dedicated to either the ISA or PCI bus. You can install only one adapter in the shared slot.

The following illustration shows the expansion slots on the riser card.

![Diagram of riser card with expansion slots]

**Note:** The diskette and IDE drive connectors are also on the riser card. When installing optional drives, refer to this illustration.
Adapter Configuration

Along with the documentation that comes with your adapter, use the following information to help with adapter configuration.

Plug and Play Adapters

A new method for configuring adapters is used by your computer. Plug and Play is a configuration method that makes expanding your computer easier. Support for Plug and Play is built into the system board of your computer.

If an adapter is Plug and Play, there are no switches or jumpers that must be set on the adapter. A Plug and Play adapter comes with configuration specifications set in memory to provide installation information to the computer during startup. When you install or remove Plug and Play adapters, this information is interpreted by the basic input/output system (BIOS), which supports Plug and Play technology. If the required resources are available, then the BIOS software automatically configures the adapter around the resources already in use by other devices.

Most adapters designed for PCI slots are Plug and Play devices; many ISA adapters are not Plug and Play devices.

Notes:

1. If a resource conflict arises after installing a Plug and Play adapter, you might need to change the default resource settings on the adapter. For more information, refer to the documentation that comes with the adapter.

2. For information on error messages from resource conflicts, see Using Your Personal Computer.
Legacy Adapters

Adapters that are not Plug and Play compatible are known as *legacy devices*. If you install a legacy adapter, you must manually configure it by setting switches on the adapter and by allocating system resources using the Configuration/Setup Utility program.

In the Configuration/Setup Utility program, the ISA Legacy Resources screen shows the computer resources that are typically required by adapters:

- Memory resources
- I/O port resources
- DMA resources
- Interrupt resources

From the appropriate screens, you can select available resources for the adapter you are installing. Resources not being used by ISA legacy adapters are listed as [Available]. You must set the resources used by the newly installed ISA legacy adapter to [Not available]; this reserves the resources for the legacy adapter and prevents the BIOS from using these resources for the system or other Plug and Play adapters.

Just as you change system resources for installed adapters, you must also change resources when you remove an ISA legacy adapter. If you remove a legacy adapter, change the resources it formerly used to [Available]. This allows the Plug and Play software to automatically use these resources for future configurations, or you can use these resources for future manual configurations.

**Note:** Refer to the documentation that comes with the adapter for information on required system resources.

For information on configuring ISA legacy adapters, see “Configuring an ISA Legacy Adapter” on page 74 or refer to *Using Your Personal Computer*. For information on error messages from resource conflicts, see *Using Your Personal Computer*.
Installing Adapters

Before you begin

- Read “Electrical Safety” on page 4 and “Handling Static-Sensitive Devices” on page 5.
- Read the instructions that come with the new adapter.
- Turn off the computer and all other connected devices.
- Disconnect all cables attached to the computer and remove the computer cover (see “Disconnecting Cables and Removing the Cover” on page 6).

1 Review the instructions that come with the adapter to determine if it must be installed in an ISA or PCI slot.

2 Remove the screw and cover for the appropriate expansion slot. If you cannot access the expansion slot screw, see “Removing the Side Cover” on page 32.

3 Touch the static-protective package containing the adapter to any unpainted metal surface in the computer; then, remove the adapter from the package.
4 Install the adapter into the appropriate slot on the riser card. Except for adapters installed on the single-slot side, the components of a PCI adapter face down toward the system board and the components of an ISA adapter face up. If a component in the computer or on the adapter interferes with the installation, use another slot.

If you are installing a full-sized ISA adapter in the bottom expansion slot, you must remove the side cover and the system board. See “Removing the Side Cover” on page 32 and “Installing a Full-Sized ISA Adapter” on page 33.

5 Go to the device-record form in Using Your Personal Computer, and write the adapter name next to the slot into which you installed it.

If you removed the side cover, see “Replacing the Side Cover” on page 36.

What to do next

- To work with another option, go to the appropriate section.
- To complete the installation, go to Chapter 6, “Completing the Installation” on page 66.
Removing the Side Cover

If you cannot access the expansion slot screw, you must remove the computer side cover.

1. Remove the three screws from the side cover.

2. Swing open the plain end of the side cover like a gate.

3. Once the side cover is standing open, lift up slightly on the pronged end and remove the side cover.
Installing a Full-Sized ISA Adapter

To install a full-sized ISA adapter in the bottom expansion slot, you must first remove the side cover and the system board.

1. Remove the side cover. (See “Removing the Side Cover” on page 32.)

2. Remove the system board.
   a. Push the system board latch down slightly to disengage the plastic tab on the latch from the system board support.
   b. Grasp and turn the latch to the extended position. This releases the system board.
   c. While pulling the latch, slide the system board out and set it aside.

3. Remove the bottom expansion slot screw and cover.
4  Slide the full-sized adapter into the bottom expansion slot, pressing on both ends to make sure it is properly seated in the riser card.

![Adapter Card](image)

5  Reinsert the system board in the computer.

   a. Make sure the system board latch is sticking out so that the tab on the underside of the latch can line up with the opening in the support. An illustration of the system board latch and the system board support follows.

![System Board Latch and Support](image)

   b. Align the system board in the track and slide it in until it stops at .2 inches from the NLX card edge connector in the riser card. If necessary, lift up on the edge of the system board to clear the bottom of the computer.

   c. When the system board is nearly seated in the NLX card edge connector, rotate the latch back. You will feel the tab on the underside of the latch
engage the support and draw the system board all the way in to seat in the connector.

Because you cannot see the connection with the full-sized adapter in place, it is important to engage the system board latch in the support to make sure it is fully seated.

6 When the system board and adapter are solidly seated, insert the screw to hold the full-sized adapter in the expansion slot.

7 Replace the side cover and the three screws (see “Replacing the Side Cover” on page 36).

8 Go to the device-record form in Using Your Personal Computer, and write the adapter name next to the slot into which you installed it.
Replacing the Side Cover

1. Hold the side cover at an angle and align the pronged end with the slots.

2. Fit the prongs into the slots and swing the side cover closed.

3. Align the holes and insert the three screws.

---

What to do next

- To work with another option, go to the appropriate section.
- To complete the installation, go to Chapter 6, “Completing the Installation” on page 66.
Removing Adapters

Before you begin

- Read “Electrical Safety” on page 4 and “Handling Static-Sensitive Devices” on page 5.
- Turn off the computer and all other connected devices.
- Disconnect all external cables and power cords, and then remove the computer cover (see “Disconnecting Cables and Removing the Cover” on page 6).

1 Locate the adapter and remove the screw.

2 Remove the adapter and insert it into a static-protective package.

If you cannot access the expansion slot screw, you must remove the computer side cover; see “Removing the Side Cover” on page 32.
3 If you are not installing another adapter in this slot, install an expansion-slot cover.

4 Go to the device-record form in *Using Your Personal Computer* and delete the name of the adapter you removed.

**Note:** Removing an adapter frees up system resources. If you remove an ISA legacy adapter, you must use the Configuration/Setup Utility program to set the previously used resources to [Available]. For more information, see Chapter 6, “Completing the Installation” on page 66.

**What to do next**

- To work with another option, go to the appropriate section.
- To complete the installation, go to Chapter 6, “Completing the Installation” on page 66.
Internal Drives

Internal drives are devices that your computer uses to read and store data. You can add drives to your computer to increase storage capacity and to enable your computer to read other types of media. Some types of drives available for your computer are:

- Diskette drives
- Hard disk drives
- Tape drives
- CD-ROM drives

Internal drives are installed in bays at the front of your computer. Within this book, the bays are referred to as bay 1, bay 2, and so on.

Your computer comes with the following IBM-installed drives:

- A 3.5-inch diskette drive in bay 4.
- A 3.5-inch hard disk drive in bay 3.
- If your computer has a preinstalled CD-ROM drive, it is installed in bay 1.

The following illustration shows the location of the drive bays in your computer.
Drive Specifications

The following table describes the drives you can install in each bay and their height requirements.

Notes:
- Drives that are greater than 41.3 mm (1.6 in.) high cannot be used.
- Drives that require removable media (diskettes, tapes, or CDs) must be installed in the accessible bays: bay 1, 2, or 4.
- PC 300PL supports only one diskette drive.
- To properly mount a 3.5-inch drive into bay 1 or 2, you must use a 3.5-inch conversion kit for a 5.25-inch bay. For more information, see your place of purchase or IBM reseller.
Power and Signal Cables

Your computer uses cables to connect the power supply to the riser card and to integrated drive electronics (IDE) drives. The diskette drive is powered through a cable attached to the riser card. The following cables are provided:

- Four-wire power cables connect most drives to the power supply. At the ends of these cables are plastic connectors that attach to different drives; these connectors vary in size. Also, certain power cables attach to the riser card. The diskette drive power cable is attached to the riser card.

- Flat signal cables connect IDE drives to the riser card; signal cables are sometimes called ribbon cables. There are two sizes of signal cables that come with your computer:
  - The wider signal cable has three connectors. Two of these connectors attach to installed drives and the third attaches to the primary IDE connector on the back side of the riser card.
  - The narrower signal cable has two connectors. They connect to the diskette drive and the diskette drive connector on the riser card.

Note: To locate connectors on the riser card, see “Adapters and the Riser Card” on page 27.

The following are some important points to remember when connecting power and signal cables to internal drives:

- The diskette drive and hard disk drive that are preinstalled in your computer come with power and signal cables attached. Also, if your computer comes with a CD drive, cables are attached. If you replace any drives, it is important to remember which cables are attached to which drives.

- When a drive is installed, ensure that the drive connector at the end of the signal cable is always connected to the drive; also, ensure that the drive connector at the other end is connected to the riser card. This reduces electronic noise from the computer.

- If more than one IDE device is used on a single cable, one must be designated as the primary or master device and all others as secondary or subordinate devices; otherwise, some of the IDE devices might not be recognized by the system. The primary or secondary designation is determined by switch or jumper settings on each IDE device.
To optimize performance when installing more than two hard disk drives, be sure to attach hard disk drives with faster data transfer speeds (Mode 1 or higher) to the primary hard disk drive signal cable (hard disk drives 0 and 1).

On some models, to install more than two IDE hard disk drives, you must purchase an additional signal cable. The cable must meet the following specifications:
- Maximum length: 0.46 meters (18 inches)
- Wire size: 28 AWG
- Cable capacitive loading: 200 pF maximum

PC 300PL supports only one diskette drive.

To attach an external drive, you must install an adapter in the computer.

**SCSI Cable**

If your computer is equipped with a SCSI adapter, a ribbon cable is provided to connect internal SCSI devices. This cable provides four connectors for attaching the SCSI adapter and up to three internal SCSI devices.

For more information on connecting SCSI devices, see the *Adaptec SCSI Documentation* provided with your computer.
Working with Drives in Bays 1, 2, and 3

To install or remove drives in bays 1, 2, or 3, you must rotate the drive cage up over the power supply of your computer. When you are facing the computer, the drive cage is located at the front, right corner.

Before you begin

- Read “Electrical Safety” on page 4 and “Handling Static-Sensitive Devices” on page 5.
- Read the instructions that come with the drive you want to install or replace.
- Turn off the computer and all other connected devices.
- Disconnect all cables attached to the computer and remove the computer cover (see “Disconnecting Cables and Removing the Cover” on page 6).
Accessing Drive Bays

Your computer comes with drives preinstalled in bays 3 and 4. Your computer may also come with drives preinstalled in bays 1 or 2. Any drive bay that lacks a preinstalled drive has a metal shield mounted on the computer frame and a bay panel mounted in the cover of the computer. Before installing any drive, you must remove the metal shield. Unless you are installing a hard drive, you must also remove the bay panel.

To access a drive bay:

1. Remove the computer cover and set it aside. For instructions, see “Disconnecting Cables and Removing the Cover” on page 6.

2. With the front of the computer facing you, remove the metal shield that covers the bay you want to use.
   a. You will need to push in the tabs on the sides of the metal shield until it flexes enough for you to lift off one side, then the other.
   b. You may need to remove the shield from bay 1 in order to get to the shield covering bay 2.

**Note:** If you remove a drive which has removable media from a bay and you do not intend to install a new drive immediately, replace the bay panel and the metal shield.
What to do next

- To remove a bay panel, go to “Removing a Bay Panel” on page 49.
- To rotate the drive cage up and rest it on the power supply, go to “Rotating the Drive Cage” on page 45.
- To install a drive, go to “Installing a Drive in Bay 1, 2, or 3” on page 47.
- To remove a drive, go to “Removing a Drive from Bay 1, 2, or 3” on page 50.

Additional Parts Required

If you are adding a drive to your computer, you may need to obtain a drive bay conversion kit.

If you plan to add 3.5-inch drive to a 5.25-inch bay, you must mount a conversion kit in the bay to hold the drive. For information about ordering this and other parts, see “Available Options and Features” on page 2.

Rotating the Drive Cage

To rotate the drive cage up from the computer and over the power supply:

1. Remove the two screws that attach the drive cage to the computer frame.
2 Carefully rotate the cage out of the computer toward the power supply. The cage will pivot back until it rests on top of the computer frame.

3 Leave the cables attached for the time being.

**What to do next**

- To install a drive, go to “Installing a Drive in Bay 1, 2, or 3” on page 47.
- To remove a drive, go to “Removing a Drive from Bay 1, 2, or 3” on page 50.
Installing a Drive in Bay 1, 2, or 3

Before you begin

- Read “Working with Drives in Bays 1, 2, and 3” on page 43.
- Read “Rotating the Drive Cage” on page 45.
- Read the documentation that comes with the drive.

Notes:

- For information on installing SCSI drives, refer to the *Adaptec SCSI Documentation* that comes with your computer.
- To install a 3.5-inch drive into drive bay 1 or 2, you must install a conversion kit. For information on purchasing a 3.5-inch conversion kit for a 5.25-inch bay, see your place of purchase or an IBM reseller.
- Remove the metal shield that covers the bay you want to use. See “Accessing Drive Bays” on page 44.

1 Touch the static-protective package containing the new drive to any unpainted metal surface and then remove the drive.

2 Insert the drive into the desired unoccupied drive bay. Remember the cage is upside down, so you must also put the drive in upside down. Then insert and tighten the screws to hold it in place. The following illustration shows a drive being installed in bay 1.

3 If applicable, repeat steps 1 and 2 to install another drive.
4 Attach the cables. Refer to “Adapters and the Riser Card” on page 27 for an illustration showing the locations of the connectors on the riser card.

5 Go to the device-record form in Using Your Personal Computer and record the new installation.

What to do next

- To access an installed drive that has removable media, you must remove the appropriate bay panel. For more information, go to “Removing a Bay Panel” on page 49.
- To remove a drive from bay 1, 2, or 3, go to “Removing a Drive from Bay 1, 2, or 3” on page 50.
- To install the drive cage, go to “Rotating the Drive Cage Back into Fixed Position” on page 53.
Removing a Bay Panel

1. Locate the appropriate bay panel in the computer cover.

2. Remove the cover (see “Disconnecting Cables and Removing the Cover” on page 6) and look inside at the back of the bay panel.

3. Use the tip of a screwdriver if necessary to flex the plastic tabs holding the bay panel in the cover.

   If you are planning to install a CD-ROM drive in bay 1, you must release the tab nearest the outside edge first.

4. Flex the bay panel a little, until both the tabs are released.

5. Remove the bay panel. The following illustrations show a bay panel being removed from bay 1.

6. Save the removed bay panel for possible future use.

7. If applicable, repeat steps 1–3 to remove another bay panel.

What to do next

- Remove the metal shield covering the bay.
- To remove a drive, go to “Removing a Drive from Bay 1, 2, or 3” on page 50.
- To install the drive cage, go to “Rotating the Drive Cage Back into Fixed Position” on page 53.
Removing a Drive from Bay 1, 2, or 3

Before you begin

- Read “Working with Drives in Bays 1, 2, and 3” on page 43.
- Read “Rotating the Drive Cage” on page 45.

After you have rotated the drive cage from the computer frame:

1. Disconnect the cables from the drive you want to remove.

2. Loosen and remove the screws holding the drive in the drive cage, and then slide the drive out of the bay.
   
   a. The following illustration shows a 5.25-inch drive (a CD-ROM) being removed from bay 1.
b. To remove a 3.5-inch hard disk drive from bay 3, you must remove the screws from the bottom of the drive, then slide the drive out of the bay. The following illustration shows the screws being removed from the drive and the drive cage.

![Diagram of removing a hard disk drive](image)

3 Place the removed drive in a static-protective package.

**What to do next**

- If you are leaving the drive bay empty, or if you are replacing a removed drive with a drive that does not have removable media, install a bay panel. For more information, go to “Installing a Bay Panel or Bezel” on page 52.
- To install a drive, go to “Installing a Drive in Bay 1, 2, or 3” on page 47.
Installing a Bay Panel or Bezel

Bay panels for drives 1 and 2 snap into the computer cover from the outside. (You do not have to take the cover off when installing a bay panel.)

A picture-frame bezel is included in the package with your manuals. It is intended to be used in place of the bay panel for bay 1 when you upgrade or install a new CD-ROM drive or other removable media type device. It accommodates industry standard removable media type devices from several manufacturers. The picture-frame bezel and bay panels snap into place from the outside of the computer cover. The illustration below shows the picture-frame bezel being installed in bay 1.

1. Align the bezel or bay panel with the opening in the computer cover.

2. Install the bezel or bay panel by pressing it in until you hear the tabs click into place.

3. If applicable, repeat steps 1 and 2 to install another bay panel.

What to do next

- To install a drive, go to “Installing a Drive in Bay 1, 2, or 3” on page 47.
Rotating the Drive Cage Back into Fixed Position

**Important**

Before rotating the drive cage back into the fixed position, connect the cables for the drives in bays 1, 2, or 3. If more than one drive is installed, attach cables to the lowest drive first and work your way up. The following illustrations show the power and signal cables being connected to drives in bays 1 and 3.

1. Push the drive power and signal cables towards the power supply and out of the way.

2. Carefully rotate the drive cage towards the front of the computer.
3 Insert and tighten the screws on top of the drive cage and computer frame.

What to do next

- To work with a drive in bay 4, go to “Installing a Drive in Bay 4” on page 57 or “Removing a Drive from Bay 4” on page 55.
- To complete the installation, go to Chapter 6, “Completing the Installation” on page 66.
Removing a Drive from Bay 4

**Before you begin**

- Read “Electrical Safety” on page 4 and “Handling Static-Sensitive Devices” on page 5.
- Turn off the computer and all other connected devices.
- Disconnect all cables attached to the computer and remove the computer cover (see “Disconnecting Cables and Removing the Cover” on page 6).

1. Loosen and remove the screw from the top of the diskette drive bracket, and disconnect the power and signal cables.

2. Slide the drive and bracket forward and out of the computer.

3. Disassemble the drive from the bracket outside of the computer, loosening and removing the screws from the sides of the diskette drive bracket.
What to do next

- Go to the device-record form in *Using Your Personal Computer* and record the installation.
- To install a drive, go to “Installing a Drive in Bay 4” on page 57.
- To install the drive-bracket assembly and complete the installation, go to Chapter 6, “Completing the Installation” on page 66.
Installing a Drive in Bay 4

Before you begin

- Read “Electrical Safety” on page 4 and “Handling Static-Sensitive Devices” on page 5.
- Turn off the computer and all other connected devices.
- Disconnect all cables attached to the computer and remove the computer cover (see “Disconnecting Cables and Removing the Cover” on page 6).

1 Working outside the computer, insert the drive into the diskette drive bracket, then insert and tighten the side screws.

2 Insert the diskette drive bracket into the computer and tighten the top screw.
3 Attach the power and signal cables. Refer to “Adapters and the Riser Card” on page 27 for an illustration showing the locations of the connectors on the riser card.

**What to do next**

- Go to the device-record form in *Using Your Personal Computer* and record the installation.
- To add a drive from bay 1, 2, or 3, see “Installing a Drive in Bay 1, 2, or 3” on page 47.
- To remove a drive from bay 1, 2, or 3, see “Removing a Drive from Bay 1, 2, or 3” on page 50.
- To complete the installation, go to Chapter 6, “Completing the Installation” on page 66.
Chapter 5. Working with Security Options

This chapter describes some of the security options that are available for your computer.

**Before you begin**

- Read “Electrical Safety” on page 4 and “Handling Static-Sensitive Devices” on page 5.
- Turn off the computer and all other connected devices.
- Disconnect all cables attached to the computer and remove the computer cover (see “Disconnecting Cables and Removing the Cover” on page 6).

To help prevent hardware theft, you can add a security U-bolt and cable to your computer. To erase lost or forgotten passwords, you can move the CMOS clear (password) jumper on the system board.

**Note:** Use the Configuration/Setup Utility program to set, change, or delete passwords. For more information, see *Using Your Personal Computer*.

To guard against writing over diskettes, you can set the write-protect switch on the system board.

The following list is a quick reference to these procedures:

- “Installing a U-Bolt” on page 60
- “Erasing Lost or Forgotten Passwords” on page 62
- “Setting the Diskette Write-Protect Switch” on page 65
Installing a U-Bolt

You can add a U-bolt to the rear of your computer. Adding a U-bolt enables you to add a security cable and lock which helps prevent hardware theft. After you add the security cable, make sure that it does not interfere with other cables that are connected to the computer.

Before you begin

- Obtain the following:
  - A 19-mm (3/4 in.) U-bolt and threaded nuts that fit the U-bolt
  - A security cable
  - A lock, such as a combination lock or padlock
  - An adjustable wrench
- Read “Electrical Safety” on page 4 and “Handling Static-Sensitive Devices” on page 5.
- Turn off the computer and all connected devices.
- Disconnect all external cables and power cords, and remove the computer cover (see “Disconnecting Cables and Removing the Cover” on page 6).

Note: The external connectors on the rear of your computer might differ from the ones shown in this section.

1 Locate the two holes on the right edge of the rear of the computer.

2 Insert the U-bolt through the rear panel; then, attach and tighten the nuts with an adjustable wrench.

3 If you cannot access the nuts with the wrench, you will need to remove the side cover. See “Disconnecting Cables and Removing the Cover” on page 6.
4 Replace the computer cover. For more information, see “Replacing the Cover and Connecting the Cables” on page 67.

5 Thread the cable through the U-bolt and around an object that is not a part of or permanently secured to the building structure or foundation, and from which it cannot be removed, then fasten the cable ends together with a lock. The following illustration shows an example of how this might work.
Erasing Lost or Forgotten Passwords

Note: To set a password, see “Setting Passwords” on page 76. To change or delete a password, see Using Your Personal Computer.

Your computer uses complementary metal-oxide semiconductor (CMOS) memory on the system board for storing configuration and setup information. CMOS memory maintains information about:

- Date and time
- Security features
- Power-management devices
- Storage devices
- Keyboard and mouse
- ISA legacy configuration information
- Plug and Play configuration information
- Port assignments
- I/O addresses and interrupts
- Other selectable features

Within the security features are the settings for the power-on and administrator passwords. If you need to erase a lost or forgotten password, you must erase all of the configuration and setup information by moving the jumper designated for CMOS memory.

---

Important

Clearing CMOS memory erases the configuration of your computer. Because you need to reconfigure the computer after clearing CMOS memory, record the configuration information of your computer before moving the CMOS jumper.
Before you begin

- Using the Configuration/Setup Utility program, record all configuration information.
- Read “Electrical Safety” on page 4 and “Handling Static-Sensitive Devices” on page 5.
- Turn off the computer and all connected devices.
- Disconnect all external cables and power cords, and remove the computer cover (see “Disconnecting Cables and Removing the Cover” on page 6).

The jumper is located on the system board; it is labeled CMOS clear. To locate this jumper, see “Identifying Parts on the System Board” on page 12 or see the label on the underside of the computer cover.

1 Move the jumper from its normal position pins (1 and 2) to pins 2 and 3. It might be helpful to use needle-nose pliers to move the jumper, but be careful not to scrape any system board components or crush the jumper.
2 Wait one minute and then move the jumper back to its normal position (pins 1 and 2). This clears CMOS memory.

---

**What to do next**

After clearing CMOS memory, you must reconfigure the computer. After reassembling the computer (go to Chapter 6, “Completing the Installation” on page 66), use the Configuration/Setup Utility program to reset the date and time, reset any passwords, and reconfigure the computer. For more information, refer to “Setting Passwords” on page 76 and *Using Your Personal Computer*. 
Setting the Diskette Write-Protect Switch

The diskette write-protect switch controls whether you can write information to a diskette using a diskette drive. The ability to prevent writing to a diskette is particularly useful if you are concerned about the security of information that can be obtained through a network.

Note: This switch does not affect the ability to read information from a diskette.

Before you begin

- Read “Electrical Safety” on page 4 and “Handling Static-Sensitive Devices” on page 5.
- Turn off the computer and all connected devices.
- Disconnect all external cables attached to the computer, and then remove the computer cover (see “Disconnecting Cables and Removing the Cover” on page 6).

1 Locate the configuration switches on the system board. For more information, refer to the label on the underside of the computer cover, or refer to “Identifying Parts on the System Board” on page 12. The write-protect switch is one of eight found in the DIP switch.

2 For normal diskette operation or for read-only diskette operation, set switch 8 as illustrated below. It might be helpful to use a ballpoint pen or a small screwdriver to set the switch.

What to do next

- To work with another option, go to the appropriate section.
- To complete the installation, go to Chapter 6, “Completing the Installation” on page 66.
Chapter 6. Completing the Installation

After working with options, you need to install any removed parts, replace the cover, and reconnect any cables, including power cords and telephone lines. Also, depending on the option installed, you might need to update information in the Configuration/Setup Utility program.

The following list is a quick reference to these procedures:

- “Replacing the Cover and Connecting the Cables” on page 67
- “Updating the Computer Configuration” on page 70
Replacing the Cover and Connecting the Cables

**Before you begin**

Read “Electrical Safety” on page 4 and “Handling Static-Sensitive Devices” on page 5.

1. Ensure that all components have been reassembled correctly and that no tools or loose screws are left inside your computer.

2. Clear any cables that might impede the replacement of the cover.

3. With a hand on either side of the top cover, set the front edge on the table in front of the computer and prop the back edge on top of the computer. Push the cover toward the rear of the computer until the back of the cover drops down.
4 Make sure you can see the volume control knob through the hole in front of the computer, and then push the cover back until it catches and fits the computer snugly. You should hear the cover click into place.

5 If the volume control knob doesn't line up with the hole, the sound card is probably out of position and needs to be adjusted. You can adjust the position of the sound card so that it sticks out of the computer at a right angle by gently lifting or lowering the front edge, before you replace the top cover.

6 If desired, go to the back of the computer and lock the cover.
7 Reconnect the external cables and cords to the computer.

8 If you have a modem or fax machine attached to the computer, reconnect the telephone line to the wall outlet and the computer. Plug the power cords into properly grounded electrical outlets.

9 Update the computer configuration. See “Updating the Computer Configuration” on page 70.

---

**Important**

In the United Kingdom, by law, the telephone cable must be connected after the power cord.
Updating the Computer Configuration

**Important**

The configuration information in this section applies to installing options. For more information on using the Configuration/Setup Utility program, see *Using Your Personal Computer*.

Also, you may need to install device drivers after updating the configuration settings. For more information, see the instructions that come with the option to determine if device drivers are required and how to install them. Also, video device drivers are on the *Ready-to-Configure CD*.

After adding, removing, or replacing options, the configuration settings will need to be updated. This reconfiguration is performed automatically by the computer or manually by you. When the computer automatically configures an option, it uses system programs. If the system programs do not update the settings, you can use the Configuration/Setup Utility program to reconfigure the appropriate settings.

For example, when you start your computer after adding most internal hard disk drives, the settings are automatically updated and you use the Configuration/Setup Utility program to save those changes. However, if a resource conflict arises after an ISA legacy adapter is installed or removed, you must manually update the computer configuration and save the information.

**Notes:**

1. Make a record of all customized settings before you make any modifications.

2. For more information on error messages from resource conflicts, see *Using Your Personal Computer*.
Starting the Configuration/Setup Utility Program

When you restart the computer for the first time after working with most options, a message appears indicating that a configuration change has occurred. You are then prompted to enter the Configuration/Setup Utility program to manually update the configuration settings or to confirm and save the settings that were automatically updated by the system programs.

After you change an option and restart the computer, the following screen might appear.

```
POST Startup Error(s)
The following error(s) were detected when the system was started:
162 Configuration Change Has Occurred
Select one of the following:
Continue
Exit Setup
```

**Note:** Depending on the configuration changes that occurred, the error message you see might be different from the one shown here.

If the preceding screen appears, select **Continue** until you reach the Configuration/Setup Utility menu.

If the preceding screen does not appear, use the following procedures to access the Configuration/Setup Utility menu.
To access the Configuration/Setup Utility program:

1. Turn on the computer.
   If your computer is on when you start this procedure, you must shut down the operating system, turn off the computer and wait a few seconds, and then restart the computer. Do not use Ctrl+Alt+Del to restart the computer.

2. When the Configuration/Setup Utility prompt appears in the lower left corner of the screen, press F1.
   a. If you have not set an administrator password, the Configuration/Setup Utility program menu appears. If you have set an administrator password, type the administrator password and press Enter.
   b. If you have set both an administrator and a power-on password, you can type either of the passwords at the password prompt. However, if you type your power-on password, you can view limited information in the Configuration/Setup Utility program, but you cannot change settings. To change settings in the Configuration/Setup Utility program, type your administrator password at the password prompt.

Note: The menu you see on your computer might look slightly different from the menu shown here, but it will operate the same way.
Changing Settings andExiting

In the Configuration/Setup Utility menus, you can accept the configuration changes by viewing and saving the changes, or you can make manual changes and then save the settings.

The following is a quick reference for identifying symbols in the Configuration/Setup Utility program. For information on the function of keys, see Using Your Personal Computer.

- If a bullet (•) is beside a menu item, then an additional menu is available.
- Most information enclosed in brackets ([ ]) can be changed. You cannot change information that is not surrounded by [ ].
- A right arrowhead (►) beside a menu item indicates that a configuration change occurred in that category. The ► might also appear in subsequent menus.
- If an asterisk (*) is beside a menu item, then a resource conflict is detected.

When you complete your changes or finish viewing information, return to the Configuration/Setup Utility menu and select Save Settings to save the changes. From this location, you can exit the Configuration/Setup Utility program.

To exit from the Configuration/Setup Utility program, follow these steps:

1. From the Configuration/Setup Utility menu, press Esc.

2. The Exit Setup menu appears. You can save your changes, exit from the Configuration/Setup Utility program without saving your changes, or return to the Configuration/Setup Utility menu. Use the arrow keys to select the desired option and press Enter.
Configuring an ISA Legacy Adapter

To configure an installed ISA legacy adapter, you might need to alter switch or jumper settings on the adapter. Also, you must use the Configuration/Setup Utility program to set the ISA legacy resource information, such as memory locations, I/O assignments, and DMA and interrupt assignments.

**Note:** For more information about required resources and switch settings, refer to the documentation that comes with the adapter.

To set the legacy resource information for an installed adapter:

1. Start the Configuration/Setup Utility program (see “Starting the Configuration/Setup Utility Program” on page 71).

2. Select **ISA Legacy Resources** from the Configuration/Setup Utility menu.

3. As needed, select Memory Resources, I/O Port Resources, DMA Resources, or **Interrupt Resources**.

4. Set the appropriate resource to **Not available**.

5. Remember to save the changes when you exit from the Configuration/Setup Utility program.

If you remove an ISA legacy adapter, you must reset to **Available** the system resources that are no longer being used. To do this, follow the above procedures and select **Available** at step 4.

**Note:** For more information on adapters and resolving conflicts, see “Adapter Configuration” on page 28 and Appendix B, “Interrupt and DMA Resources” on page 79.
Configuring Startup Devices

Startup devices are devices that the computer initiates when it is powered on. After adding new devices to the computer, you might want to change the sequence of the startup devices. You can use the Configuration/Setup Utility program to configure startup devices.

To configure startup devices:

1. Start the Configuration/Setup Utility program (see “Starting the Configuration/Setup Utility Program” on page 71).
2. Select Start Options from the Configuration/Setup Utility menu.
3. Select First Startup Device.
4. Use the arrow keys to make your selection.
5. If necessary, repeat the above steps for Second Startup Device, Third Startup Device, and Fourth Startup Device.
6. Remember to save the changes when you exit from the Configuration/Setup Utility program.
Setting Passwords

If you used the CMOS-clear jumper to erase the computer configuration and setup information, you must reconfigure the computer, set the date and time, and reset the power-on or administrator passwords.

Note: For more information on password protection and setting the date and time, see Using Your Personal Computer.

To reset the power-on or administrator passwords:

1. Start the Configuration/Setup Utility program (see “Starting the Configuration/Setup Utility Program” on page 71).
2. Select System Security from the Configuration/Setup Utility menu.
3. Select Administrator Password or Power-on Password.
4. Follow the instructions to change the password. For more information, see the passwords section of Using Your Personal Computer.
5. Remember to save the changes when you exit from the Configuration/Setup Utility program.

Note: For information on clearing CMOS memory, see “Erasing Lost or Forgotten Passwords” on page 62.
Appendix A. Changing the Battery

If you replace the original lithium battery with a heavy-metal battery or a battery with heavy-metal components, be aware of the following environmental consideration. Batteries and accumulators that contain heavy metals must not be disposed of with normal domestic waste. They will be taken back free of charge by the manufacturer, distributor, or representative, to be recycled or disposed of in a proper manner.

Before you begin

- Read “Electrical Safety” on page 4 and “Handling Static-Sensitive Devices” on page 5.
- Read the instructions that come with the replacement battery.
- Turn off the computer and all connected devices.
- Disconnect all external cables attached to the computer and then remove the computer cover (see “Disconnecting Cables and Removing the Cover” on page 6 if you need additional information).

For information on locating the battery, see “Identifying Parts on the System Board” on page 12.

1 If necessary, remove any adapters or cables that might impede access to the battery. For instructions, see “Removing Adapters” on page 37.

2 Read “Lithium Battery Notice” on page vi.

3 Remove the old battery.
4 Install the new battery.

Note: When the computer is turned on for the first time after battery replacement, an error message might be displayed. This is normal after replacing the battery.

What to do next

- To work with another option, go to the appropriate section.
- To complete the replacement, go to Chapter 6, “Completing the Installation” on page 66.
- Use the Configuration/Setup Utility program to set the date and time and any passwords. For information on setting the date and time, refer to Using Your Personal Computer. For information on setting passwords, see “Setting Passwords” on page 76.
- Dispose of the old battery as required by local ordinances or regulations.
Appendix B. Interrupt and DMA Resources

This appendix lists the settings for the default interrupt and direct memory access (DMA) resources for your computer.

Note: The interrupt and DMA settings might change under configuration control.
